- We independently developed the architecture of our initial uniform QUBO and QAOA model.

- We planned the successive improvements across all three versions ourselves.

- We identified bottlenecks from the results at each stage and chose methods to address them. Our report explains this progression in detail.

- We used Claude and ChatGPT mainly for research and learning, including understanding Boltzmann weighted QUBO and gradient-based training.

- We also used AI for debugging and general coding assistance.

- At times, we used AI to help run early versions of the codebase and obtain their results.
